CLINICAL OBSERVATIONS & NOTES:

Patient's hemoglobin, WBC count, platelet count, and kidney function markers are within normal limits. However, fasting blood glucose at 108 mg/dL indicates a pre-diabetic state and warrants dietary intervention. Lipid panel reveals borderline-high total cholesterol (215 mg/dL) and elevated LDL (135 mg/dL) and triglycerides (180 mg/dL), suggesting dyslipidemia. Blood pressure readings are mildly elevated. Recommend lifestyle modifications including a low-carb, low-fat diet, regular aerobic exercise (30 min/day), weight management, and a follow-up lipid panel and HbA1c in 3

months. If no improvement, pharmacotherapy may be considered.
